

## Post operation endophthalmitis and the education role as prevention guideline.

Sayyid mazhari M; MSc<sup>1</sup>

### Abstract

**Background:** Endophtalmitis refers to infection within the eye, particularly infection of vitreous, because the vitreous is in direct contact with the retina, Endophtalmitis is a vision –threatening condition and must be managed as an emergency. The clinical out come depends both upon the virulence of the infecting organism, the speed with which appropriate therapy is initiated and the education about clinical features of endophtalmitis.

**Materials and methods:** for this review article, I have searched through the site pubmed and uptodate by the following key words: Endophtalmitis, nursing.

**Results:** Endophtalmitis is a wide spread accident which can occur after cataract or other ophthalmic surgery, which can cause blindness. Therefore, for management and preventing, we can have some guideline as a nurse educator.

**Keywords:** Endophtalmitis, nursing
